

Q.1) Explain the following terms with one example each:

a) Corrosion

b) Rancidity

Ans. a) Corrosion $\Rightarrow$ "When the item made of iron or iron like metals such as tin are attacked by substances around them such as moisture, acids, etc. they are said to corrode and the process is called corrosion."

b) Rancidity $\Rightarrow$ The process of oxidation of food items (containing fats and oils), due to which there is change in taste and smell is known as rancidity.

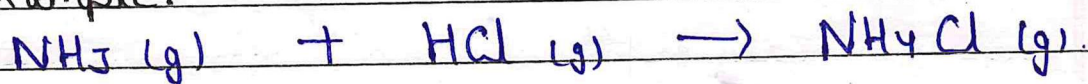

Examples: The food items like chips and other Namkeens fried in oils and kept for a long time, fats and oil present in them get oxidised and they start giving an unpleasant smell and

change the taste.

Q.2) Why should a magnesium ribbon be cleaned before burning in air?

Ans:) Combination (Addition) Reaction: "Such a chemical reaction in which two or more reactants (substances) join to form a single new compound is called combination (Addition) Reaction."

Example:

Q.3) What is the displacement (Substitution) reaction? Give an example.

Ans:) Displacement (Substitution) Reaction: "Such a reaction in which one more reactive element displaces another less reactive element from its compound and acquires its position, is called Displacement (Substitution) Reaction."

Example:

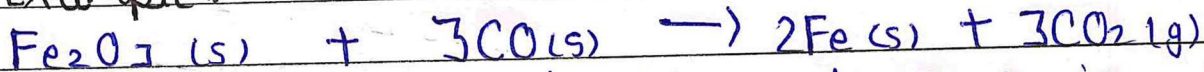

Q.4) What do you mean by Oxidation-Reduction (Redox) reaction? Give an example.

Ans:) Oxidation - Reduction (Redox) Reaction: "Such a chemical reaction in which one reactant is oxidised and another is

Reduced is called Oxidation - Reduction
(Redox) Reaction."

Example:

Here, CO is oxidised and Fe_2O_3 is reduced
